

Biometric Systems

This book provides practitioners with an overview of the principles & methods needed to build reliable biometric systems. It covers 3 main topics: key biometric technologies, testing & management issues, & the legal and system considerations of biometric systems for personal verification/identification. It focuses on the 4 most widely used technologies - speech, fingerprint, iris & face recognition. It includes: In-depth coverage of the technical and practical obstacles which are often neglected by application developers & system integrators & which result in shortfalls between expected and actual performance; Detailed guidelines on biometric system evaluation; Protocols & benchmarks which will allow developers to compare performance & track system improvements. **Biometric Systems - Technology, Design and Performance Evaluation** is intended as a reference book for anyone involved in the design, management or implementation of biometric systems.
