

The Software Factory: Managing Software Development and Maintenance

Intended for information processing managers and staff, and for user management involved with information processing, this new edition covers questions about productivity tools, measurement, motivation, project control, and planning. It discusses the effective management of information technology resources, and gives practical advice on delivering and maintaining quality software systems. Topics discussed include expert systems, code generators, 3GL productivity, 4GLs and prototyping. The author has also published *Managing for Productivity in Data Training*, and has contributed work to *Datamation*, *Computerworld*, and *Journal of System Management*.
