

# Security Protocols: 7th International Workshop Cambridge, UK, April 19-21, 1999 Proceedings (Lecture Notes in Computer Science)

Another year, another workshop. Here are the proceedings of the seventh Cambridge International Workshop on Security Protocols. All very well, you may think, but can there really still be anything genuinely new to say? Is it not just the same old things a tiny bit better? Well, perhaps surprisingly, this year we discovered some radically new things beginning to happen. The reasons in retrospect are not far to seek: advances in technology, changes in the system context, and new types of consumer devices and applications have combined to expose new security requirements. This has led not only to new protocols and models, but also to known protocols being deployed in delicate

new ways, with previous fragilities of watermarking and actual authentication, for example, becoming desirable features. At the workshop we identified several of these developments and began to map out some lines of enquiry. This volume brings you a selection of deliberately disputatious positions - papers, followed by not-quite-verbatim transcripts of the discussions which they provoked. As always, our purpose in making these proceedings available to you is the hope that they will move your thinking in an unexpected direction. If you find your attention caught by something here, if it makes you pause to reflect, or to think why, that is just so wrong, then good. We're waiting for your mail.
